

Best Practices in Credit Union Member Experience Measurement

Introduction

The question was simple enough... If you owned member experience measurement for one of your credit union clients, what would you do?

Through the years, I developed a point of view of how to best measure the member experience, and shared it with a number of clients, however, never put it down to writing.

So here it is...

Best practices in credit union member experience measurement use multiple inputs in a coordinated fashion to give managers a 360-degree view of the member experience. Just like tools in a tool box, different research methodologies have different uses for specific needs. It is not a best practice to use a hammer to drive a screw, nor the butt end of a screwdriver to pound a nail. Each tool is designed for a specific purpose, but used in concert can build a house. The same is true for research tools. Individually they are designed for specific purposes, but used in concert they can help build a more whole and complex structure.

Generally, Kinēsis believes in measuring the member experience with three broad classifications of research methodologies, each providing a unique perspective:

1. Member Feedback – Using member surveys and other less “scientific” feedback tools (such as comment tools and social media monitoring), managers collect valuable input into member expectations and impressions of the member experience.
2. Observation Research – Using performance audits and monitoring tools such as mystery shopping and call monitoring, managers use these tools to gather observations of employee sales and service behaviors.
3. Employee Feedback – Frontline employees are the single most underutilized asset in terms of understanding the member experience. Frontline employees spend the majority of their time in

the company-member interface and as a result have a unique perspective on the member experience. They have a good idea about what members want, how the institution compares to competitors, and how policies, procedures and internal service influence the member experience.

These research methodologies are employed in concert to build a 360-degree view of the member experience.

The key to building a 360-degree view of the member experience is to understand the credit union-member

The key to building a 360-degree view of the member experience is to understand the credit union-member interface. At the center of the member experience are the various channels which form the interface between the member and institution. Together these channels define the brand more than any external messaging. Best in class member experience research programs monitor this interface from multiple directions across all channels to form a comprehensive view of the member experience.

Members and front-line employees are the two stakeholders who interact most commonly with each other in the member-institution interface. As a result, a best practice in understanding this interface is to monitor it directly from each direction.

Tools to measure the experience from the member side of interface include:

Post-Transaction Surveys

Post-transaction surveys provide targeted, event-driven feedback from members about specific service encounters soon after the interaction occurs. They provide valuable insight into both member impressions of the member experience, and if properly designed, insight into member expectations. This creates a learning feedback loop, where member expectations can be used to inform service standards measured through

Comments & Feedback

mystery shopping. Thus two different research tools can be used to inform each other.

Beyond surveying members who have recently conducted a service interaction, a best practice is to provide an avenue for members who want to comment on the experience. Comment tools are not new (in the past they were the good old fashioned comment card), but with modern Internet-based technology they can be used as a valuable feedback tool to identify at risk members and mitigate the causes of their dissatisfaction. Additionally, comment tools can be used to inform the post transaction surveys. If common themes develop in member comments, they can be added to the post-transaction surveys for a more scientific measurement of the issue.

Social Monitoring

Increasingly social media is “the media”; prospective members assign far more weight to social media than any external messaging. A social listening system that analyzes and responds to social indirect feedback is increasingly becoming essential. As with comment tools, social listening can be used to inform the post transaction surveys.

Mystery Shopping

Directing our attention to the credit union side of the interface, tools to measure the experience from the credit union side of credit union-member interface include:

In today’s increasing connected world, one bad experience could be shared hundreds if not thousands of times over. As in-person delivery models shift to a universal associate model with the branch serving as more of a sales center, monitoring and motivating selling skills is becoming increasingly essential. Mystery shopping is an excellent tool to align sales and service behaviors to the brand. Unlike the various member feedback tools designed to inform managers about how members feel about the credit union, mystery shopping focuses on the behavioral side of the equation, answering the question: are our employees exhibiting appropriate sales and service behaviors?

Employee Surveys

Employee surveys often measure employee satisfaction and engagement. However, in terms of understanding the member experience, a best practice is to move employee surveys beyond employee engagement and to understand what is going on at the member-employee interface by leveraging employees as a valuable and inexpensive resource of member experience information. This information comes directly out one side of the member-employee interface, and provides not only intelligence into the member experience, but also evaluates the level of support within the organization, solicit recommendations, and compares perceptions by

Member Surveys

The Member Side of the Credit Union-Member Interface

position (frontline vs. management) to identify perceptual gaps which typically exist within organizations.

Many credit unions conduct periodic member satisfaction research to assess the opinions and experiences of their member base. While this information can be useful, it tends to be very broad in scope, offering little practical information to the front-line. A best practice is a more targeted, event-driven approach collecting feedback from members about specific service encounters soon after the interaction occurs.

These surveys can be performed using a variety of data collection methodologies, including e-mail, phone, point-of-sale invite, web intercept, in-person intercept and even US mail. Fielding surveys using e-mail methodology with its immediacy and relatively low cost, offers the most potential for return on investment. Historically, there have been legitimate concerns about the representativeness of sample selection using email. However, as the incidence of email collection of credit unions increases, there is less concern about sample selection bias.

The process for fielding such surveys is fairly simple. On a daily basis, a data file (in research parlance “sample”) is generated containing the members who have completed a service interaction across any channel. This data file should be deduped, cleaned against a do not contact list, and cleaned against members who have been surveyed recently (typically three months depending on the channel). At this point, if you were to send the survey invitations, the credit union would quickly exhaust the sample, potentially running out of eligible members for future surveys. To avoid this, a target of the required number of completed surveys should be set per business unit, and a random selection process employed to select just enough members to reach this target without surveying every member.

So what are some of the purposes credit unions use these surveys for? Generally, they fall into a number of broad categories:

Post-transaction surveys are event-driven, where a transaction or service interaction determines if the member is selected for a survey, targeting specific members shortly after a service interaction. As the name implies, the purpose of this type of survey is to measure satisfaction with a specific transaction.

¹ Kinēsis uses an algorithm which factors in the targeted quota, response rate, remaining days in the month and number of surveys completed to select just enough members to reach the quota without exhausting the sample.

New Account & On-Boarding

New account surveys measure satisfaction with the account opening process, as well as determine the reasons behind new members' selection of the credit union for a new deposit account or loan – providing valuable insight into new member identification and acquisition.

Closed Account Surveys

Closed account surveys identify sources of run-off or churn to provide insight into improving member retention.

Mystery Shopping

The Behavioral Side of the Credit Union-Member Interface

Mystery shopping is an excellent tool to align sales and service behaviors to the brand.

“You can expect what you inspect.”

This management philosophy is as true today as it was 50 years ago when W. Edwards Deming used it. Mystery shopping is more than a pure measurement technique conducted properly; it is an excellent motivational tool to motivate appropriate sales and service behaviors across all credit union delivery channels.

Unlike the various member feedback tools designed to inform managers about how members feel about the credit union, mystery shopping focuses on the behavioral side of the equation, answering the question: are our employees exhibiting appropriate sales and service behaviors?

It is the employees who animate the brand, and it is imperative that employee sales and service behaviors be aligned with the brand promise. Actions speak louder than words. Brands spend millions of dollars on external messaging to define an emotional connection with the member. However, when a member perceives a disconnect between an employee representing the brand and external messaging, they almost certainly will experience brand ambiguity. The result severely undermines these investments, not only for the member in question, but their entire social network. In today’s increasingly connected world, one bad experience could be shared hundreds if not thousands of times over. Mystery shopping is an excellent tool to align sales and service behaviors to the brand.

So...what behaviors, channels and employees should be shopped?

Sales channels and sales behaviors offer the most ROI relative to other types of shopping. In terms of prioritizing mystery shopping resources, shops of sales channels and sale behaviors should be the first priority. With the increasing use of universal associates and transforming tellers into sellers, it is incumbent on managers to measure and motivate these higher level sales skills, in both branches and contact centers. After sales behaviors have been prioritized, if resources remain for mystery shopping service scenarios can be included in the mix.

As for the specific measurements, the best practice for mystery shop design is to focus on empirically measureable employee behaviors captured with objective questions. (Was a specific behavior present or not?...Yes or no). The best methodology for deciding which questions to ask is to start with your brand promise, and determine which sales and service behaviors animate the brand. Once you have developed a list of expected behaviors, the next step is to map each behavior to a specific question. Avoid compound questions which ask about two different behaviors, unless you

expect both behaviors to be present at the same time, and you are not worried about distinguishing if one is present without the other.

Open-Ends

Open-ended questions, either in narrative form or qualitatively asking what shoppers liked or disliked about the experience, add valuable context for understanding the member experience. Many clients consider these qualitative observations the heart of the shop.

Subjective Impressions

While the core of the mystery shop is objective measurements of specific behaviors, there is a place for subjective impressions. Rating scales are used to capture shopper impressions of various dimensions of the member experience, as well as the overall experience itself. These subjective ratings provide valuable context for interpreting the member experience, and specifically the efficacy of the objective behaviors measured. For example, purchase intent ratings calculate a correlation between the objective behaviors measured and purchase intent, identifying which behaviors may be more important in terms of driving purchase intent, and which investments in training, incentives and rewards have the most potential for ROI.

Finally, given mystery shopping measures employee behaviors against credit union service standards, it is a best practice to calibrate and align service standards with member expectations by constantly feeding information uncovered with the member surveys back into the service standards and mystery shopping. Such an informed feedback loop between member surveys and mystery shopping will ensure the behaviors measured are aligned with member expectations.

Employee Surveys

Leverage Unrecognized Experts in the Member Experience

Frontline member facing employees (tellers, platform, and contact center agents) are a vastly underutilized resource in terms of understanding the member experience. They spend the majority of their time in the member-credit union interface, and as a result tend to be unrecognized experts in the member experience.

An excellent tool to both leverage this frontline experience and identify any perceptual gaps between management and the frontline is to survey all levels of the organization to gather impressions of the member experience. This survey can be fielded very efficiently with an online survey.

Typically, we start by asking employees to put themselves in the members' shoes and to ask how members would rate their satisfaction with the member experience, including specific dimensions and attributes of the experience. A key call-to-action element of these surveys tends to be a question asking employees what they think members most like or dislike about the service delivery.

Next we focus employees on their own experience, asking the extent to which they believe they have all the tools, training, processes, policies, member information, coaching, staff levels, empowerment, and support of both their immediate supervisor and senior management to deliver on the company's service promise. Call-to-action elements can be designed into this portion of the research by asking what, in their experience, leads to member frustration or disappointment, and soliciting suggestions for improvement. Perhaps most interesting, we ask what are some of the strategies the employee uses to make members happy. This is an excellent source for identifying best practices and potential coaches.

Finally, comparing results across the organization identifies any perceptual gaps between the frontline and management. This can be a very illuminating activity.

Social Listening

Filling in the White Spaces

Social listening fills in the white spaces between other research tools. Its value lies in correlating social data with other data sources.

Increasingly social media is “the media”; prospective members assign far more weight to conversations on social media than any external messaging. A social listening system that analyzes social media conversations, while still a little immature, are increasingly becoming a valuable source of member comments.

Social media analytics software collect data across multiple sources (Facebook, Twitter, Google+, etc) using text analytics in an effort to reveal patterns, identify trends and detect potential business problems from what people are saying in these online forums.

While these analytical tools are still a little immature, sentiment analysis technology has become more capable in recent years. Among the common features of these tools is sentiment tracking of conversations, determining if the sentiment is positive or negative and tracking a ratio of sentiment over time. Additionally, these tools typically mine text for specific key words. Beyond automated analytics, we’ve had success using this unstructured social feedback and reducing it into quantifiable themes through a manual process of coding, where comments are read and grouped by theme. While a manual process, we’ve found taking a sampling of social conversations and manually reviewing them, provides valuable context not available through pure automated analytics.

Like comment monitoring, social listening is not a standalone research tool. It is not a survey, nor is the data collected from a representative sampling of members, as such, it is not statistically valid. Social listening, however, fills in the white spaces between other research tools. Its value lies in correlating social data with other data sources.

Research without call to action elements may be interesting, but not very useful. As with all research tools, call to action elements should be built into a social listening program. Any time there is negative criticism, it presents an opportunity for process improvement. Among the ways managers can act of social listening are trend identification, finding chronic member complaints, and identifying and correcting root causes of member complaints.

Additionally, managers should construct processes to identify and respond to social conversations where appropriate. Members who have had a problem fixed are famous for becoming vocal advocates of a company. The flip-side is that members who have had a positive experience can be thanked for their feedback, which encourages member loyalty. Try to respond to each review (positive or negative), thank the client for their feedback constructively and professionally, address the issue, and offer solutions to correct the issue and leave it at that.

Finally, the unsolicited nature of social conversations offer a unique opportunity to feed themes identified in these conversations back into member survey design, allowing managers to determine if issues uncovered are broadly present across all members.

Member Comments

A New Look at Comment Cards

Four Groups of Comment Providers

- Extremely Happy Customers
- Extremely Unhappy Customers
- Extremely Bored Customers
- Customers with Requests

Dear [President's name]:

Here is something I would like you to know . . .

[Lots of white space]

Sincerely yours,

[Space for name, address and phone number]

Member comment tools provide financial institutions a valuable tool to identify and reply to members who have had a negative service experience and may be at risk for attrition or spreading negative word of mouth.

Beyond randomly surveying members who have recently conducted a service interaction at a branch or call center, credit unions should also provide an avenue for self-selected member feedback, feedback from members who have not been selected to participate in a survey, but want to comment on the experience.

In the past, this vehicle for collecting this unsolicited feedback would be the good old fashioned comment card. Today, the Internet offers a much more efficient means of collecting this feedback. For the branch channel, invitations to provide feedback with a URL to an online comment form can be printed on transaction receipts. For call centers, members can be directed to IVR systems to capture voice feedback from members. Website and mobile users can be offered online comment forms as well.

Unsolicited feedback tools are not surveys, and should not be used as surveys. In fact, they make terrible member satisfaction surveys. Many institutions try to turn them into surveys by asking members to rate such things as service, convenience and product selection. But these comment channels do not give reliable information because they do not come from typical members. The people who fill out the cards tend to fall into one of four groups: extremely happy members, extremely unhappy members, extremely bored members, and members with requests (for products, new store locations, etc.).

Notice the operative word in the first three categories: extreme. If a member is satisfied with the product or service, why bother to give feedback? Members expect to be satisfied. Having your expectations met is not something to write about. In research parlance, the sample is self-selected, and the people who provide such feedback are not likely to be representative of the general population of members. It therefore makes no sense to ask these people to provide ratings that are going to be tabulated and averaged. The results will be useless at best and completely misleading at worst.

A better approach is to design them as letters to the credit union president. They look something like the template to the left.

Additionally, the check box can be included asking the member if they would like someone to contact them as a result of their feedback.

This type of feedback tool will deliver valuable qualitative data about the experience that prompted the member to provide the feedback.

It is essential that a system for analyzing and responding to the feedback be put into place. First, sort the comments according to if the member wants a reply to their feedback. There are ways to streamline this process, but to ignore it is to make matters worse, because members (the angry ones, at least) will expect a reply. On the other hand, responding to member concerns makes comment tools exceptionally valuable. First, they provide a method to identify and reply to members who have had a negative service experience and may be at risk for attrition or undermine the brand with negative word of mouth, and even worse social media commentary. Second, they Minimize negative word-of-mouth advertising that would undermine marketing efforts; and increase positive word-of-mouth advertising (members who have had a problem fixed are famous for becoming vocal advocates of a company). The flip-side is that members who have had a positive experience can be thanked for their feedback, which encourages member loyalty.

The next step in acting on the qualitative feedback is to reduce it into quantifiable themes through the process of coding, where comments are grouped by theme. For instance, 18% of comments may have referred to “slow service” and 14% to “lack of job knowledge”. Now, we can monitor the frequency of various themes by business unit and over time.

Comment tools are not new, but with modern technology can be employed as a valuable feedback tool to identify at risk members and mitigate the causes of their dissatisfaction.

Finally, the unsolicited nature of member comments offer a unique opportunity to feed themes identified in member comments back into member survey design, allowing managers to determine if issues uncovered are broadly present across all members.

Comment tools are not new, but with modern technology can be employed as a valuable feedback tool to identify at risk members and mitigate the causes of their dissatisfaction.

Conclusion

Best practices in credit union member experience measurement use a variety of research tools in a coordinated fashion to give managers a view of the member experience from all sides of the credit union-member interface. Member surveys, mystery shopping, employee surveys, social monitoring, and comment tool used in concert gives managers a complete view of this credit union-member interface and the member experience.
